

The annotated consoles

Four screens, explained region by region — and a record of why the explanation is in this document instead of on the screen.

4 role consoles 597 tests 8 languages console :3100 · api :8090

THE DECISION THIS DOCUMENT RECORDS

A console is operated, not read

The consoles used to carry their own explanation: paragraphs above each panel saying what the panel was for, a six-card walkthrough telling a presenter what to point at. It was accurate and it read as a description of a system rather than a system.

An officer at 07:00 has a queue to clear. A commander at a morning brief has one question. Neither of them is a student of the design. So the explanatory layer was lifted out — into this document — and the screens were rebuilt as dense, scannable, action-first surfaces.

WHAT THE SCREENS WERE

Full-width prose cards. Every panel introduced before it was shown. /demo was six numbered steps of presenter script. A visitor read about what the system would show them.

WHAT THE SCREENS ARE

A filterable queue with a close-out that blocks. A sub-unit matrix with one headline. A tabbed assurance console. /demo is now the control room: live stage timings, funnel

counts, four doors.

Nothing was deleted. Everything the screens used to say is on this page, and the presenter script survives intact as its own document.

PLATE 1 OF 4

Welfare officer

The only console that ever sees a name. It shows escalated cases and nothing else — the cases the gates declined do not appear here and no identity exists for them.

Today's queue /officer

WELFARE_OFFICER

- 1 **Shift header**
3 to review · 1 close-out due · 0.67 precision

- 2 **Run-health banner**
only rendered when something is wrong

CASE	PRIORITY	ACTION
1a120eaf3d...	HIGH	WLF-COUNSEL
7c4e2b91af...	ROUTINE	WLF-LEAVE

- 3 **Why now**
three SHAP drivers, in plain language

- 4 **Gate arithmetic**
click a bar, the formula opens

- 5 **Counter-argument**
above the buttons, deliberately

- 6 **Reveal identity · contact · defer**
each writes to the ledger

- 7 **Close-out — required**
four categories, nothing free-text

- 1 **Measured precision, not claimed precision.** The figure comes from closed cases in this officer's own history — how often a contact found a real welfare concern. An officer who can see the system's hit rate can calibrate how much weight to give it.

- 2 **A short queue is reported, never hidden.** If a connector returned partial records, those domains are excluded rather than imputed, and the banner says so. Silence would let a thin night look like a calm one.

- 3 Model attribution translated out of feature names. Not `roster_var_30d = 0.41` but “their shift pattern has been irregular for a month”.
`A driver an officer cannot repeat aloud is not an explanation.`

- 4 **Amber, never red.** A gate that does not clear is usually the correct answer — the machine declining to accuse somebody. Red would tell the reader the opposite of what happened.

- 5 **The case against sits above the action buttons.** An officer who clicks “contact” and then reads that 61% of the unit shows the same pattern has been given an instruction, not decision support. Reading order is the control.

- 6 The audit entry is written *before* the name is looked up, and a failed write aborts the disclosure.
`There is no ordering in which a name exists without a record of it.`

- 7 **Supported · not supported · already known · declined.** Only the category is stored — never what was said in a welfare conversation. These four answers are also what recalibrates the model, so an officer closing a case is training it.

PLATE 2 OF 4

Commanding officer

A commander is never given a list of people. That is the design, not a permission setting — word that reporting strain is career-limiting is all it takes for the honest answers to stop arriving, and then the system is worth nothing.

1 Header

2 cells raised · 10 suppressed · $k \geq 5$ · 36.0€ left

2 One-sentence headline

"B Coy – duty roster is high."

SUB-UNIT	LEAVE	ROSTER
A Coy	nomi	low
B Coy	mode	high
Sig Pl	—	—

3 Raised, in order

worst first, band as a chip

4 Not shown here

an explicit list of what is withheld

5 Levers you hold

rotation · leave backlog · day-14 relief

1 The privacy budget is on the commander's own header. One unit heat map costs about 24€ of a 60€ budget. Showing the remaining figure makes the cost of looking visible to the person doing the looking.

2 This sentence is the product for this role. It is what gets repeated at the morning brief, so it names a sub-unit and a domain and stops. Not "composite 0.71" — a commander cannot act on a composite.

3 Bands, not values. A cohort fraction rendered as 0.6104 invites a commander to compare two sub-units that differ by noise.

Four bands is the resolution the data actually supports.

- 4 **Three protections, and the third is the subtle one.** Cells under $k=5$ people are *suppressed, not rounded*. The self-report, biometric and voice domains are withheld from command at any group size. And a repeated view is served from a release cache — fresh noise on every refresh averages back to the truth, so refreshing would otherwise be an attack.
- 5 Every lever listed is one a commander controls without knowing who is affected: rotation, the leave backlog, relief before a consecutive-days run reaches fourteen.
- A finding with no available lever is a worry, not information.

PLATE 3 OF 4

Governance auditor

The only console that sees the refusals — 125 of them on the run these figures come from, against 3 escalations. An auditor is checking whether the machine refuses for defensible reasons, so the near-misses are the whole job.

Assurance /audit

AUDITOR

1 Header

125 refused · 125 monitor · chain INTACT

2 Refusals / Ledger / Privacy budget

three tabs, refusals first

SUBJECT

VERDICT

MISS

pid-mon-0001

MONITOR

0.006

4f8ab2c701...

MONITOR

0.041

3 Gate arithmetic, expanded

4 What would change the verdict

the gate, run backwards

5 Hash-chained ledger

1 **The refused list is auditor-only, and the API enforces it.** A welfare officer requesting it gets 403. Handing an officer a nearly-flagged queue would mean they work it, which lowers the threshold to zero and undoes the refusal.

2 Sorted nearest-miss first. The case that failed by 0.006 is where the thresholds actually did the work; the one that failed by 0.4 was never close.

An auditor with limited time should spend it on the boundary.

3 The same four sums the officer would have seen, with the one that fell short in amber. The published case fails consistency at 0.694 against a 0.700 threshold, because 45–61% of the unit is deviating the same way and the unit is deployed.

4 **Computed by inverting the failed gate. Never generated.** It is the threshold arithmetic run backwards, which is why it can be trusted: it cannot describe a route that would not in fact clear the gate. “Recoverable” distinguishes a case that more evidence could change from one blocked structurally, by a missing consent.

5 Append-only, each entry carrying the hash of the one before it, so a deleted or edited row breaks verification for everything after it. The header reads **INTACT** or **BROKEN** and nothing in between.

Withdrawal of consent is readable here and nowhere else – no count, no rate, no per-unit view exists for a dashboard to group by.

PLATE 4 OF 4

Personnel

This console has to be worth opening for the person’s own benefit. If it reads as surveillance, adoption collapses — and a voluntary self-assessment is worth a fifth of the evidence gate on its own, so that channel dying is not a cosmetic loss.

1 **Language picker**
हिन्दी • বাংলা • मराठी • ਪੰਜਾਬੀ • தமிழ் • తెలుగు • اردو

2 **Status tiles**
domains allowed • contact • consent recorded

3 **It can see / It cannot see**
two columns, before the toggles

4 **What I allow**
records • self-report • biometric • voice

5 **Wellness self-assessment**
PHQ-9, real items and scoring

6 **Consent receipt**
language • text version • timestamp

7 **If you are struggling right now**
never folded away

- 1 **Complete, or not offered.** A missing translation key is a build failure, never an English fallback — a consent screen that switches to English halfway through has stopped being a consent screen.

Script-aware typography: uppercase and letter-spacing are disabled outside Latin.

- 2 The three things a person needs on opening: what they have allowed, whether a welfare officer may contact them, and whether their consent is on record.

- 3 Deliberately above the toggles. Knowing what becomes visible is a precondition of agreeing to it, so the order is not negotiable even though it costs space above the actions.

- 4 Per-domain, and **voice has its own toggle**. Agreeing to have your leave record read is not agreeing to be recorded, and defaulting it on would make the distinction meaningless. It is off by default.

- 5 Real PHQ-9 items and real scoring. **Item 9 bypasses every gate** — it routes straight to a mental-health authority with an SLA measured from submission, without waiting for a persistence window.

A validated instrument's translation cannot be invented; the locale files refuse to serve one that has not been supplied.

- 6 **Consent is to a specific text, in a specific language, at a specific version.** The receipt records all three. An unreviewed translation cannot ground consent, so saving is refused against draft text rather than accepted quietly.
- 7 **The one card on the page that never folds.** Everything else a person reads once on enrolment is behind a disclosure triangle; a person in difficulty should not have to find and click one to reach a helpline number.

THE OBJECT EVERY PLATE IS ARRANGED AROUND

One case, refused by 0.006

Both the officer's console and the auditor's render this same object. It is the reason the system exists: every reason to name somebody, and a refusal.

Why this is the moment, and not the escalation

Three domains deviating, sustained across months, evidence at 1.000. On any dashboard built around a risk score this is a flag. But 45–61% of this jawan’s unit is deviating the same way, because the unit is deployed — and a unit-wide pattern is a command workload problem, not an individual welfare concern.

No name is produced. Instead the system states what would change its mind, computed by inverting the gate that failed:

“the duty_roster deviation is still present after the unit’s current deployment cycle ends (op-tempo confounder, 0.70)”

THE AUDIT OF THIS CHANGE

What moved, and where it went

SCREEN	WHAT IT USED TO CARRY	WHERE THAT IS NOW
/officer	Introductory prose per panel; gate explanations inline; close-out categories described before use.	Plate 1 above. The screen kept the reading order that matters — counter-argument above the buttons.
/unit	Paragraphs on k-anonymity, differential privacy and the release cache.	Plate 2 above. The screen kept a short “not shown here” list, because a commander should be able to see the limits without leaving.
/audit	Explanation of nearest-miss ordering, chain verification and the epsilon budget.	Plate 3 above, and a short version on the budget tab.
/me	“And these things never happen” — the reassurance list read once at enrolment.	Folded into a disclosure on the screen, and Plate 4 above. Not removed: it is what consent is given against.
/demo	Six numbered cards of presenter script: what to say, what to point at, why.	Its own document — the demo run-sheet. The screen is now the control room.

What deliberately stayed on the screens

The honest limits

- The counter-argument, above the action buttons
- “Not shown here” on the commander’s view
- What each role *cannot* see, on the control-room doors
- The helpline card, unfolded, on the personnel app
- Every refusal message — a refused page explains itself rather than disappearing

- There is no real dataset. The cohort is generated from seed 26186, and the training label is circular — the model learns the generator.
- Voice cannot detect somebody who says “I’m fine” *and sounds fine*. That limit is written down as a test, not hidden.
- Compute scales to a national force on one server. The escalation rate does not scale — that is a threshold and staffing decision, and the dial is exposed.

Every figure on these plates was read from the running system, not written by hand.

Companion documents: how SAMVEDNA decides · in plain words · the demo run-sheet

Welfare support, never disciplinary action. Outputs are barred in software from ACR, promotion, posting and disciplinary processes.
