

SAMVEDNA DEMO IN SIX CUES

Eight minutes, four chairs, one refusal. Every figure below is what the running system currently shows — read it off the screen, don't recite it.

8

MINUTES

6

CUES

4

ROLES

3

TO CLOSE ON CUE 3

BEFORE YOU OPEN YOUR MOUTH

Pre-flight — do this ten minutes early

- 1 Run `./run.sh` from the `samvedna` folder. Wait for “**ready: http://localhost:3100**”. It will not say ready until the stylesheet actually loads, so if it says ready, the page is fine.
- 2 Open `localhost:3100/demo` in one tab. Leave it there — it is your prompt sheet, and each cue signs you into the right role.
- 3 Click **Sign out** on the role bar, so you start as a member of the public. The first thing judges should see is the pitch, not somebody's caseload.
- 4 Zoom the browser to **110–125%**. The gate formulas are the point and they are small at 100% on a projector.
- 5 If anything looks unstyled, the servers went down. `./run.sh` again — it takes about 40 seconds.

THE SIX CUES

Run it in this order

Each cue is: where to click, what to say, what to point at. The **red** one is the one that wins the room — don't rush to it and don't go past it.

1 The problem, and the shape of a night

PUBLIC

1 MIN

DO

localhost:3100 → scroll to "The scale of the problem"

SAY

“654 CAPF personnel died by suicide between 2018 and 2022 — one every three days. 50,155 resigned or took early retirement in five years. And the records that would have warned us were already sitting in the files. **Nobody was reading them together, because no human could.**”

THEN SCROLL TO THE FUNNEL AND SHOW

screened	240
something changed	128
watched, not named	125
named to an officer	3

“That last number is the product. Not the 240 — the 3.”

2 A case that cleared all four gates

WELFARE OFFICER

2 MIN

DO

/demo → cue 2 "Enter as Welfare Officer" → Open case → click any gate bar

SAY

“This is 07:00 the next morning. Three cases, not 240. Watch what she gets for each one.” **Click a gate bar.** “That is the actual sum, with the actual numbers in it. She can defend this to the man sitting opposite her.”

POINT AT, IN THIS ORDER

composite	0.905
evidence	0.754 / 0.65 PASS
consistency	1.000 / 0.70 PASS

persistence	0.943 / 0.60	PASS
actionability	1.000 / 0.50	PASS
roster rhythm	longest unbroken run 31 days	
action	WLF-COUNSEL	

THE LINE JUDGES REMEMBER

Scroll to “**The case against — read this first**” and say: “Notice where this sits. **Above** the buttons. She reads the argument against the flag before she is able to act on it. That is the difference between decision support and an instruction.”

FINISH THE LOOP

Click **Reveal identity** — “logged before the name is looked up” — then **Record contact**, and show the red banner appear: *close-out required*. Try closing with nothing selected; you can't.

3 What it refused to say

AUDITOR

2 MIN

DO

/demo → cue 3 "Enter as Auditor" → "What the system refused to say" → Why not

SAY

“She saw three names. The system looked at 240 people, and for **125 of them it decided to say nothing**. This is where a governance board reviews those refusals — sorted nearest-miss first, because the near misses are where the thresholds are actually doing their work.”

OPEN THE TOP ONE AND READ IT OUT

total refused	125
nearest miss	consistency, by 0.003
the sum	$\text{mean}(0.712, 0.708, 0.650) = 0.690$
needed	0.700

THIS IS THE WHOLE PITCH — SLOW DOWN HERE

“Three thousandths of a point. This man had a real, sustained, multi-record pattern — and his unit was moving with him, because the unit is deployed. So the system

produced **no name at all**. And then it did the thing I want you to remember: it told us exactly what would have changed its mind, in words an officer can go and check.”

ADD THE SECOND HALF

“And notice **who is looking at this screen**. It's the auditor, not the welfare officer. Handing an officer the list of people the gates refused to name would undo the refusal — so she cannot open this page. The server refuses her, not the menu.”

IF YOU HAVE TO STOP, STOP HERE

“It did not stay silent because we told it to. It stayed silent because the arithmetic came out that way — and it said exactly what would have changed it.”

4 The same night, from the CO's chair

COMMANDING OFFICER

1 MIN

DO

/demo → cue 4 "Enter as Commanding Officer" → then click UNIT-02

SAY

“Same data, same morning, different chair. A CO gets a heat map of where his unit is running hot, so he can fix rosters. **13 of 24 squares are showing. The other 11 are removed** — not blurred, removed — because they cover fewer than five people.”

THEN BREAK IT ON PURPOSE

Click **UNIT-02**. “He's scoped to UNIT-01. Watch.” **Refused**. “And there is no 'show me who' button anywhere on this screen — not because we hid it, but because the data that reached this page contains no identifier at all. There is nothing to drill into.”

5 What the jawan sees

PERSONNEL

1.5 MIN

DO

/demo → cue 5 "Enter as Personnel" → click हिन्दी → then اردو

SAY

“This has to be worth opening for **his** benefit. If it reads as surveillance, nobody fills anything in and the best signal we have dies.” **Click** हिन्दी. “Eight languages, each in its own script.” **Click** اردو. “Including right to left.”

SHOW THREE THINGS FAST

- The page *opens* with “what this system can and cannot see about me” — before any toggle.
- The **welfare-contact toggle is separate**. Turn it off: “he can allow the analysis and still refuse to be approached — and then no officer ever sees his name, whatever the analysis finds.”
- Press **Save my choices** while in Hindi. *It refuses*. “No native speaker has verified that translation yet, so the system will not record consent against words nobody has checked.”

OPTIONAL, IF THEY LOOK INTERESTED

Take the PHQ-9. Answer **anything above zero on question 9** and show the response: contacted today, routed to a mental-health authority, *never* to the CO, and it bypasses all four gates.

6 Everything anybody did

AUDITOR

45 SEC

DO

```
/audit → scroll past the refusals to the ledger → filter  
disclosure.granted
```

SAY

“Everything you just watched me do is in here. The name I revealed in cue two, with my operator ID. The close-out. Every entry carries the hash of the one before it — **alter one and every hash after it breaks.**”

POINT AT

ledger entries	131
chain	verified
privacy budget	13.0 of 60.0 ε spent

CLOSE ON

“And if this ledger had failed to write, the name would never have been released. The audit record is written **before** the name is looked up. There is no order of operations in which somebody gets named without a record of it.”

Q & A

The questions you will actually be asked

“What's your model accuracy?”

“About 0.92 AUROC on our synthetic data — and I'd ask you to ignore that number. The published research gets 0.72 on real records, and **we designed for that**. The four gates exist because the model is not good enough to be trusted alone, and no accuracy figure would change that.”

“What if the model is wrong?”

“It is, often. That's why a score of 1.000 changes no gate value and no verdict — we have a test that asserts it. And if the model file is missing entirely, the night still runs and still escalates the same people.”

“Won't this stigmatise people?”

Go back to cue 3. “125 people were looked at and deliberately not named. Weak evidence produces **no name at all** — not a watchlist, not a maybe. And only a welfare officer ever sees an identity.”

“Could a commander misuse it?”

Cue 4 again. “His screen contains no identifier. There is no API that would answer 'who is it'. And ACR, promotion, posting and disciplinary purposes are refused for **every** role — in the software, with a test.”

“Why would a jawan consent?”

“Because the app gives him something: his own trend, the reasons the officer saw, and one-tap withdrawal that nobody is told about. And his self-assessment is worth a fifth of the evidence gate — it's the only input he controls.”

“Have you tested it on real data?”

Say no, plainly. “No. Everything you've seen runs on realistic synthetic records. Phase 1 of our rollout is shadow mode on one battalion's retrospective data — the gates run, every verdict is recorded, and *no alert is issued to anybody* — so thresholds get calibrated before a single officer is asked to act.”

“What about voice analysis?”

“That's an add-on we explored after submission, and it's labelled as one. It's tiered so it can corroborate a case and never make one. And it's honest about its limit — a man who hides it well is invisible to voice, which is exactly why the other eight signals carry the case.”

“What's left to build?”

“Three things. Seven of our eight translations need a native speaker — the system refuses consent against them until then. Airflow, Keycloak and Postgres are wired as swappable seams but never run against the real thing. And nothing has touched a real record.”

IF SOMETHING BREAKS LIVE

Page looks unstyled — the servers dropped. `./run.sh`, about 40 seconds. It won't say ready until the stylesheet loads.

A page says “Refused” — that is almost certainly the demo working. Check the role bar at the top: you are signed in as somebody who can't see that screen. Say so out loud; it makes the point for you.

No network at the venue — doesn't matter. Nothing here touches the internet. No cloud, no external API, no fonts fetched from anywhere.

Laptop dies — `uv run samvedna cohorts` and `uv run samvedna case pid-mon-0001` run the whole gate engine in a terminal, formulas and all.

ONE SENTENCE

If you only get thirty seconds

“Everyone builds a risk score. We built the thing that decides whether a risk score is allowed to become a name — **and most nights, for most people, the answer is no.**”

Every figure on this sheet was read from the running system. Re-check them before you present — `./run.sh` generates a fresh night each time, so the case IDs and the nearest-miss margin will differ.
